1 INTRODUCTION

1.1 Purpose

TrackMe is a company aiming to support interactions between users, who like keeping track of the health status and their activities, and third parties which can use data and enhance their value.

TrackMe app is composed of three main important service:

- BPM: beats per minutes;
- Data4Help: basic support for health data;
- AutomatedSOS: add support for SOS services to elderly people;
- Track4Run: add support for running events.

Each of them will have as targets:

- Individuals users
- Third parties.

Since each service serves both the targets, the project consists of platform divided in a mobile application and a web-based interface to serve third-parties.

The system allows individual users to add and handle data on the app and to third parties to request and have access to these data.

In particular, a user of the application is able to keep track of his/her position during the activities but also during the normal day-life. The users' data are used to monitor the heartbeat and eventually to send an AutomatedSOS. Furthermore, TrackMe, is able to track all the athletes (that are using the application), during a run previously organized. Indeed TrackMe's app provide a section to setup a group run , specifying the path and other useful information.

1.2 Scope

1.2.1 Description of the problem

The software developed by TrackMe included three different services: Data4Help supports user's data acquiring through smartwatches or similar devices, Data4Help is also a service available for third-parties: in fact, organizations can request data to TrackMe and collect them for pursuing their objectives. Data acquisition can be performed in two different way: directly to a single user or to a groups of individuals. Concerning the single user case, companies, through a social security code, ask permission to access the corresponding information. In the other case, organizations can request, directly to TrackMe, data of group of individuals with particular proprieties (e.g. users between 20 and 30 years old or living in a certain district). In the latter, TrackMe provides data only if it can anonymized them correctly.

1.2.2 World Phenomena

1.2.3 Machine Phenomena

- Third-parties registration;
- user's registration;
- data anonymization.

1.2.4 Shared Phenomena

1.2.5 Goals

- [G1] Allow users to add data to TrackMe manually or let the application collect them automatically.
- [G2] Allow users to have access to an overview page of their data.
- [G3] Allow users to permit/deny third parties to access their data.
- [G4] Allow users to monitor her/his health parameters.
- [G5] Allow users to monitor her/his performance during run workouts.
- [G6] Send to user's location emergency services in case of low vital parameters.
- [G7] Guarantee very efficient time reaction in case of low vital parameters detection.
- [G8] Allow a user to create an event defining run path and other event settings.
- [G9] Allow users to en-roll to events.
- [G10] Allow spectators to follow participants' live position during events.

- [G11] Allow third parties to request users to provide their personal informations.
- [G12] Allow third parties to request TrackMe to provide anonymised aggregated data.
- [G13] Allow third parties to subscribe to data feeds.
- [G14] Allow third parties to retrieve data from TrackMe through and URL end-point (API).

1.3 Definitions, Acronyms, Abbreviations

1.3.1 Definitions

1.3.2 Acronyms

- API: Application Programming Interface
- ASOS: AutomatedSOS
- D4H: Data4Help
- RASD: Requirement Analysis and Specification Document
- T4R: Track4Run

1.3.3 Abbreviations

G_n : n-th

D_n : n-th domain assumption

R_n : n-th functional requirement

1.4 Revision history

1.5 Reference Documents

1.6 Document Structure

2 OVERALL DESCRIPTION

2.1 Product perspective

2.2 Product functions

2.3 User characteristics

2.4 Assumptions, dependencies and constraints

3 SPECIFIC REQUIREMENTS

3.1 External Interface Requirements

- User Interfaces
- Hardware Interfaces
- Software Interfaces
- Communication Interfaces

3.2 Functional Requirements

3.3 Performance Requirements

3.4 Design Constraints

- Standards compliance
- Hardware limitations
- Any other constraint

3.5 Software System Attributes

- Reliability
- Availability
- Security
- Maintainability
- Portability

- 4 FORMAL ANALYSIS USING ALLOY
- 5 EFFORT SPENT
- 6 REFERENCES
